Abstract - The aim of the study: Identify the correlation between the internal control center and sense perceptions - kinesthetic (horizontal distance jump, grip strength, the horizontal distance and emptiness of the arm) to the squad of the Kurdistan region of Iraq karate The researchers postulated the existence of a positive correlation statistically significant between the internal control and sense perceptions - (distance of the horizontal jump, grip strength, the horizontal distance and emptiness of the arm) to the squad of the Kurdistan region of Iraq karate. The researchers used the descriptive manner connectivity relationships for suitability objectives and problems of the research and the research sample consisted of twenty players were selected for the deliberate manner of squad team Kurdistan region of Iraq karate. After that players had been chosen by testing the control center and perceptive Sensory Perception - kinesthetic tests, it has been processing the data statistically by the statistical program (spss), and the researchers concluded that there were significant correlation between the control centers of the relationship and All tests Motor Sensory Perception Testing Sensory Perception under study.
